

ThreatPulse

Your Product Roadmap — Step by Step Guide

■ PHASE 1 — Today — Test Your Product

1. Download the HTML file

Save the `cyber_threat_dashboard.html` file to your desktop.

2. Open in browser

Double-click the file — it opens in Chrome or Firefox. No server needed.

3. Click around

Test the filters, search, click cards to see the detail panel. This is YOUR product.

4. Note what you want to change

Write down anything you want to improve — bring that list back here.

■ Most people never get this far. You already have a working product.

■ PHASE 2 — Next 3 Days — Put It Online (Free)

1. Create GitHub account

Go to github.com → Sign up free. This is where your code lives.

2. Create Vercel account

Go to vercel.com → Sign up with your GitHub account.

3. Upload your file

In Vercel, create new project → drag and drop your HTML file.

4. Get your live link

Vercel gives you a URL like: `threatpulse.vercel.app` — share it with anyone.

■ Both GitHub and Vercel are completely free for personal projects. No credit card needed.

■ PHASE 3 — Next 2 Weeks — Improve the Dashboard

1. Come back here

Tell me what you want to add or change — I will update the code instantly.

2. Ideas to ask me

World map of attacks · Email alerts for new CVEs · Better attack tree visuals · Export to PDF

3. Add your branding

Change the name, colors, logo to make it fully yours.

4. Test on mobile

Open the link on your phone — check if it looks good.

■ Each iteration makes your product better. Small improvements add up fast.

■ PHASE 4 — Next Month — Share It With the World

1. Post on LinkedIn

Write: "I built a free cybersecurity threat intelligence dashboard. Here's the link." Keep it simple.

2. Post on Reddit

Share on r/netsec and r/cybersecurity — these communities love free tools.

3. Add to your resume

List it as a real project with the live URL. This impresses employers.

4. Collect feedback

Ask people what features they want — let your users guide your roadmap.

■ One post in r/netsec can bring hundreds of users overnight.

■ PHASE 5 — Month 2+ — Monetize (Optional)

1. Watch usage

If people use it daily, there is real value — consider a Pro tier.

2. Add Pro features

Email alerts, API access, team dashboards, custom filters.

3. Pricing suggestion

Free tier (current) + Pro at \$5-10/month. Use Stripe for payments.

4. Mobile app later

Once the web version is proven, then build the mobile app for Play Store / App Store.

■ Validate with web first. Mobile app costs money (\$25 Play Store + \$99/yr App Store). Earn it first.

Free Tools You Will Use

Tool	Purpose	Cost	URL
GitHub	Store your code	FREE	github.com
Vercel	Host your website	FREE	vercel.com

Supabase	Database for future features	FREE	supabase.com
Claude (me!)	Update & improve your code	FREE	claude.ai
Google Play	Publish Android app (later)	\$25 one-time	play.google.com/console
App Store	Publish iOS app (later)	\$99/year	developer.apple.com

Remember: You already have a working product. Every step from here is just making it better.
